workday | WORKDAY SUCCESS PLANS

WSP OPTIMIZATION PACKAGE WORKSHOPS

Workday Extend:

Explore Common Design Patterns
Workshop Homework

To prepare for Day 2 discussions, please complete the following **homework**.

Homework Objective

Now it's time to build on the patterns discussed in today's session!

Across the stages below, you'll select a predefined business scenario or a custom challenge from your team, map it to the appropriate design pattern, and document its implementation details and business value.

Don't worry about having perfect answers for everything — the goal is to think critically and identify what you know versus what you still need to figure out.

If a question is unclear or requires more internal discussion or collaborative discussion during the lab, simply make a note of it. We'll review all questions and discussion points on Day 2.

Stage 1: Review the Four Workshop Design Patterns

	Pattern	Business Case Requirement
Pattern 1	Filter Down Before Fetch	High-data volume, advanced search criteria, performance optimization before payload return.
Pattern 2	View-Grid with Row-Detail Edit	Inline data adjustments, fast batch-editing of list items, responsive UI updates
Pattern 3	Data Ingestion and Extraction	Processes require real-time external submission, response retrieval and PMD page updates without manual tracking or re-entry.
Pattern 4	Item-Level Sub-Status / Partial Resolution	Track independent transaction Status values and BP event references for nested sub-entities.

Stage 2: Map the Business Scenarios to Design Patterns

Scenario	Scenario Use Case	Design Pattern
Purchase Request	An application that allows facilities managers to submit a purchase line with new suppliers that have not been approved yet.	Select a Pattern
Timesheet Correction Tool for Payroll Admins	Payroll admins to view all time entries and edit certain records that may need updates to their hours or cost center codes.	Select a Pattern
The Regional Asset Lookup	Need an application for IT technicians to review equipment records for certain companies, locations, or departments.	Select a Pattern
Badge Photo Check	An application that submits a new hire's uploaded photo for a badge and confirms whether that photo is valid.	Select a Pattern

Stage 3: Document Business Scenario and Value

Select a business scenario from Stage 2—or introduce a custom use case from your own team—and document the business scenario and value using the questions below.

Use this Box to Document the Business Scenario and Value

Here are some items to document (if applicable):
Business Scenario Name:
Appropriate Design Pattern:

Business Scenario Details:

- What is the primary user action?
- What is the data volume being processed?
- Where do the core logic and state reside?
- Is real-time inline editing required for tabular data?
- What is the failure mode if this pattern is missing?
- Are there multiple components requiring approvals or validations?
- Is external system or API data required? (If yes, specify the data type and format: JSON/XML).

Business Value (Focus on Design Pattern):

- **Operational Efficiency and User Impact:** How does implementing this specific pattern directly reduce manual effort, navigation friction, or processing time for the end user?
- **Risk Reduction and Scalability:** What measurable operational bottlenecks, administrative delays, or compliance risks does this pattern prevent as transaction volumes grow?

Completed Sample

Business Scenario Name: Employee Offboarding Asset Recovery Tracker

Appropriate Design Pattern: Pattern 4 (Item-Level Sub-Status / Partial Resolution)

Business Scenario Details:

- **Primary Action:** Track and update the return status of individual assets (like laptops and badges) independently during offboarding.

  Data Volume: 5–15 sub-assets per departing employee across multiple active cases.

- **Core Logic and State:** Managed within Workday Extend, tracking independent line-item statuses and linking child assets to parent business processes.

- **Inline Editing:** Yes, tabular inline updates for tracking individual asset statuses.

- **Failure Mode Without Pattern:** Entire offboarding cases get blocked and stalled if a single minor asset is delayed.

- **Approvals and Validations:** Multi-department sign-offs (IT, Security, HR) clearing individual sub-items independently.

- **External API Data:** REST API integration with external asset management tools using JSON to sync device data and wipe confirmations.

Business Value (Focus on Design Pattern):

- **Operational Efficiency and User Impact:** Eliminates manual tracking and multi-page navigation by allowing teams to manage multiple assets on a single screen, significantly reducing administrative effort and processing time.

- **Risk Reduction and Scalability:** Prevents workflow bottlenecks by ensuring a delayed minor asset doesn't stall the entire offboarding process, while maintaining security and compliance as organization size and transaction volumes grow.
